SUMMARY

Full-stack developer based in Hanoi with 6 years of experience shipping production software at banks, robotics companies, and AI startups across Vietnam. Specializes in performant web apps, reactive backends, and interfaces that scale. Currently open to full-time and contract work.

EXPERIENCE

CMC Global

May 2022 — Present

Full-Stack Developer · Hanoi, Vietnam
Technologies: Java, Spring Boot, React.js

Co-well Asia

Jan 2020 — May 2022

Mobile Developer · Hanoi, Vietnam
Started my career here as a fresher/junior mobile developer, building native Android and React Native applications.
Technologies: Android, Java, React Native

PROJECTS

AMS — Application Management Service (ITSM)

CMC Global · Mar 2026 — Now

Problem: About 20 legacy internal systems had accumulated years of tech debt with little to no monitoring, so incidents were often caught by users first and root causes took days to trace through undocumented code.

What I built: Acted as the last line of technical escalation — root-causing production incidents across the systems, shipping fixes directly in their Java, React, Vue, and C# codebases, and writing L2-facing instructions so recurring issues could be resolved without escalating to L3.

- Root-cause investigation for L3-escalated incidents across ~20 legacy systems
- Direct incident fixes across Java, React, Vue, and C# codebases
- Wrote L2 handling instructions/runbooks to reduce repeat escalations
- Reviewed code for change requests and production hotfixes before release
- Owned last-line technical escalation for the application

Tech stack: Java, React.js, Vue.js, C#, ITSM

AION — Web App (NDA client)

CMC Global · Dec 2025 — Mar 2026

Problem: Monthly KPI reporting relied on Excel sheets shared over email — each cycle took 4+ hours to compile, was error-prone, and gave managers no live visibility into department performance.

What I built: A React + TypeScript dashboard with real-time KPI completion rings per employee, department-level roll-up views, date-range selectors, and a manager approval flow.

- Built and maintained the KPI tracking dashboard UI
- Integrated REST APIs for performance data
- Collaborated with backend team on API contract design
- Ensured responsive layouts for tablet and desktop

Tech stack: React.js, TypeScript, Ant Design, REST API, Spring Boot

HDBank Mobile — Mobile App (NDA client)

CMC Global · Dec 2024 — Nov 2025

Problem: No dedicated mobile channel existed for customer payments and voucher-based promotions — it needed to be built from scratch to handle high-throughput transaction processing at launch scale.

What I built: Built the Payment Service and Voucher Service backend from the ground up using Spring WebFlux reactive streams, with DB index tuning and a Redis cache layer for repeat voucher queries, alongside the React Native frontend.

- Backend: Payment Service and Voucher Service
- Database tuning and performance optimization
- API contract definition with the frontend team
- Unit tests and code reviews

Tech stack: Java, Spring Boot, WebFlux, React Native, TypeScript, Redis, PostgreSQL

C-Ticket — Web App (Internal)

CMC Global · Jun 2024 — Nov 2024

What I built: Full-stack: React.js frontend with a live SLA countdown, WebSocket push for status changes, and a Spring Boot backend with configurable SLA rules per priority level.

- Full-stack development — React frontend + Spring Boot backend
- WebSocket for real-time SLA updates and notifications

Tech stack: Java, Spring Boot, React.js, WebSocket, PostgreSQL

C-Now — Jira Plugin (Internal)

CMC Global · Sep 2023 — Nov 2024

What I built: A full Jira Server plugin: custom workflow states mapped to finance approval stages, a REST API bridge to internal services, and a jQuery-based UI panel embedded directly in Jira tickets.

- End-to-end plugin development (Java backend + JS frontend)
- Jira workflow configuration and custom field mapping

Tech stack: Java, Spring Core, JavaScript, jQuery, Jira Server SDK, REST API

Warehouse Control System — WCS (Private client)

CMC Global · May 2022 — Aug 2023

What I built: An Eclipse RCP backend for inbound/outbound flow management and a D3.js real-time visualization layer showing live bin occupancy, robot positions, and exception queues. WebSocket bridge to the Autostore API.

- Backend: business logic and database management
- DB tuning and performance optimization

Tech stack: Eclipse RCP, Java, Node.js, WebSocket, PostgreSQL

SKILLS

Frontend	React.js (4y), TypeScript (3y), React Native (2y), Android / Java (1y)
Backend	Spring Boot (4y), Java (4y), WebFlux (2y), Node.js (2y)
Data & Ops	PostgreSQL (4y), MySQL (3y), Redis (3y), Jenkins (2y)

EDUCATION

Posts and Telecommunications Institute of Technology (PTIT)	2015 — 2020
